DevPrint

Project Description

Problem:
Recruiters and hiring managers often spend significant time manually reviewing GitHub profiles to evaluate developers. This process is inconsistent, time-consuming, and makes it difficult to quickly identify strong candidates.

Solution:
DevPrint converts GitHub profiles into recruiter-ready snapshots. It analyzes repositories, activity, and metadata to provide a clear, actionable overview, including contact information and social handles.

Target Users

- Recruiters & hiring managers
- Developers seeking a shareable profile summary

Core Features

- AI-generated recruiter insight
- Structured snapshot with key metadata
- Impact score: stars, forks, followers, activity
- Language distribution visualization
- Developer archetype classification
- Contact info extraction from bios & READMEs
- Shareable report links

How It Works

1. Fetches GitHub profile & repository data
2. Analyzes activity & language usage
3. Computes impact score from engagement metrics
4. Generates recruiter-focused summary via AI endpoint (with fallback)

Tech Stack

- **Frontend:** Vanilla HTML/CSS/JS (no framework)
- **Backend:** Vercel Serverless Function (Node)
- **APIs:** GitHub REST API, Anthropic Messages API
- **AI:** Claude Haiku 4.5
- **Hosting:** Vercel
